

Prototyping in parallel from our decision to use the segmented control design pattern was immensely useful, as it helped us weigh alternatives over how best to represent administrator data.

Pros:

Segmented controls are a familiar design pattern for organizing different kinds of information.

Cons:

Admins were confused when selecting multiple users, but only being able to add one.

The two data tables in the “subteams and parent team” view cause cognitive overload with admins not being able to focus on two tables at the same time

Visual dissonance with segmented controls taking up the whole screen

Inconsistencies with data table - breaks down in edge case scenarios, lack of search bar in one control, but is present in the other. User selection in one data table, but not the other.
